

Music Player

Create an iTunes like music player using WPF. The app allows user to browse from a list of songs, create a playlist, add/remove titles from the playlist, browse by artist, albums.

Goal is to match the user interface, layout, styling as much as possible while incorporating elements of WPF, MVVM, styling, databinding, controls, data grid, panels, navigation, inputs, and commands.

- List of songs for display can be read from a file locally or can be hard coded.
- Extra credit for unit testing (view-model and model)

Note: No need to playback the music

During the panel interview, try to run the application in visual studio. If there is issue, we can run it.
